Ordered groups, arbitrary length

K = $[k_0, \ldots, k_{n-1}]$, with arbitrary length n.

dot(X, Y), one concrete binding

b_a ↔ b_b share batch group B.

Group	X positions	Y positions
B	[0]	[0]
I	[1, 4]	—
K	**[2, 3]**	**[5, 2]**
J	—	[1, 3, 4]

K pairs: X[2] ↔ Y[5], then X[3] ↔ Y[2].

Positions are zero-based; — means absent.

Output: B ++ I ++ J

Reduced over K
